

ABSTRACT OF THE DISCLOSURE

A multi-tape measuring tool has a recoil-type tape measure and a removable ruler-type measure stored in a single housing. Conventionally, a user, such as an architect or an engineer, would have to carry one retractable tape measure along with a separate smaller ruler-like measuring tool, the smaller tool being useful, for example, in more confined spaces. The measuring tool of the presenting invention provides both a retractable tape measure and a separate ruler-like measuring tool stored in a single, easily carried unit.
